

CM Barnett Pharma Services

Do you store products? If so you can't afford to miss this:

Temperature Mapping of product storage areas

Following the adoption of the updated EU GDP Guidelines in 2013, it has become more important than ever to document how you ensure that medicinal products are held under appropriate environmental conditions.

As well as protecting the goods from damage, contamination or spoilage, you need to provide suitable temperature control. And you need to provide the regulatory agencies with documented proof!

One element of this is the need to undertake and document a study to map the range and distribution of temperatures throughout the storage facility

What can we do to help?

CM Barnett Pharma Services is well placed to assist you with this. We operate a transparent menu-priced policy for providing the following services:

- On-site assessment of current facility and temperature monitoring
- Design of temperature mapping protocol, on the basis of risk to product quality
- Provision of temperature sensors, individually calibrated against standards traceable to national standards
- Instructions regarding placement, OR placement of monitors by our trained staff.
- Preparation of a full documented report as an electronically-signed and certified PDF document, including plan of sensor locations and copies of calibration certificates

All you have to do is carefully collect the temperature sensors and return them to us at the end of the study.
